	Introduction	xiii
1	Context analysis	1
	1.1 Introduction	1
	1.2 Historical perspective of RFID	1
	1.3 RFID towards a networked society	4
	1.4 Standardization	6
	1.5 Circuit challenges for RFID systems	7
	1.6 Materials and technology	10
	1.7 Computer aided design (CAD) and optimization	11
	1.8 Conclusions	12
	Acknowledgment	12
	References	12
2	RFID background	17
	2.1 RFID system architecture	17
	RFID system general frame	17
	RFID regulation	19
	RFID technology	23
	2.2 Fundamentals and advances in RFID antenna design	27
	2.3 Smart RFID tagged objects: from conventional RFID to networked RFID	
	systems and green solutions	30
	References	35
3	Energy scavenging and storage for RFID systems	38
	3.1 Introduction	38
	3.2 Modeling vibrational energy harvesters	41
	Electromagnetic generators	43
	Piezoelectric generators	44
	State of the art and benchmarks in vibrational energy harvesters	46
	3.3 Thermoelectric generators	48

3.4	Scavenging architectures for vibrational and thermoelectric	
	energy harvesters	50
3.5	Scavenging architecture for RFID rectenna and voltage multiplier	52
	General purpose approach to the design of the rectenna	55
	Selection of rectenna components	57
	Antenna topology	57
	Rectifier topology	61
	Antenna(s)/rectifier(s) architecture	63
	Rectenna design results	64
3.6	Design of power conversion circuits	66
Refe	prences	70
Tech	nologies for RFID sensors and sensor tags	76
4.1	RFID sensor concept and constraints	76
	RFID sensor architecture	76
	Active and passive RFID tags	76
	RFID sensor technology for wireless sensor networks	77
	Power constraints	78
	Current technological challenges	80
4.2	SAW-based RFID sensors	82
	Basic principles of SAW RFID sensors	82
	Design of SAW RFID sensors	83
	Fields of application	85
4.3	CMOS-based RFID sensors	85
	System architecture of a CMOS RFID system	85
	Multi-standard analog frontend	87
	Ultra-low-power rectifier	87
	Tag-to-reader communication	92
	Reader-to-tag communication	92
	Clock generation and clock recovery	93
	Sensor interface	94
	Wireless sensing	94
	Timing constraint	95
	Time-domain comparator	97
	Digital-to-analog converter	98
	Temperature sensor	102
	Distance measurement	103
	Local positioning	103
	Modulated back-scattering with passive transponders	106
	Measurement setup for distance measurement	106
	User defined EPC custom command for distance	
	measurement	106
	CMOS RFID system tests	109
4.4	Comparison of SAW and CMOS RFID sensors	111
Refe	erences	111

5	Unc	onventional RFID systems	116
	5.1	Introduction	116
		Efficient and energy-aware approaches	119
		RFID for location	120
		RFID for household applications	121
	5.2	Efficient and energy-aware approaches	121
		Extending the coverage range of RFID systems	122
		The radio link using multi-sine signals	123
		Multi-sine power-link	124
		Multi-sine data downlink	125
		Multi-sine data uplink	127
		Laboratory test beds and measurements	129
		Measurement setup 1	129
		Measurement setup 2	130
		Measurement setup 3	132
		Results discussion	134
		Protocols for reduction of energy consumption	134
		Proposed architecture and algorithm	135
		Signal strength measurement	135
		Preliminary measurements	137
	5.3	UWB location based on passive sensors	139
	5.4	RFID for household applications	143
		A battery-less remote control system based on a multi-RFID scheme	143
		Proposed system	144
		The novel N-port microstrip network	146
	Refe	erences	150
6	Inte	grating tiny RFID- and NFC-based sensors with the Internet	152
	6.1	Introduction	152
	6.2	RFID-based networked prototypes	153
		Semi-passive	153
		Solar-powered UHF tag for localization	153
		WISP-based	156
		Concealable and flexible antennas for the WISP module	156
		Multipacket reception for the RFID EPC Gen2 protocol	157
		Chemical gas sensing	158
		Passive	160
		Paper-based ultra-high frequency sensor	160
		Metallic structural strain sensor	161
	6.3	NFC-based networked prototype	163
	6.4	Using WSNs to interface with the internet	165
		Crossbow WSN for location tracking	166
		ZigBee	168
		SWIM – smart wireless integrated module	168
		Near-field certificate of authenticity reader	169

		IPV6-enabling 6lowPAN	169
		Extensions to mobile and pico-datacenter computing	172
	6.5	Conclusion	172
	Refe	erences	173
7	Mate	erials for substrates	176
	7.1	Introduction	176
	7.2	Substrate characterization	178
		Ring resonator method	178
		T resonator method	180
		Transmission line (TL) method for substrate loss	181
	7.3	Fabrication method for various substrates	184
		Subtractive processes	184
		Milling	184
		Lithography	184
		Additive processes	185
		Inkjet printing	185
		Screen printing	188
		Mixed processes	189
	App	endix 7A: The effective width and effective permittivity	191
	Refe	erences	193
8	Orga	anic conductors and semiconductors: recent achievements and modeling	195
	8.1	Introduction	195
	8.2	Active devices for printed RFIDs	196
		Modeling tools for organic devices	196
		High frequency rectifiers based on organic Schottky diodes	197
		Basic devices and circuits based on organic TFT	200
	8.3	Passive RFID components	203
		Graphene: the wonder material	203
		Basic properties of graphene	204
		Analogy of ballistic transport and electromagnetic waves:	
		a rich concept	206
		Fabrication of graphene	207
		Modeling of the electromagnetics-quantum transport	
		in graphene nanodevices	208
		Frequency domain: the combined Dirac-Poisson problem	209
		Time domain: the combined Dirac–Maxwell problem in the	
		ballistic regime	213
		Graphene antennas for RFID and wireless applications	215
		Graphene in the microwave and mm-wave range	216
		Antenna design and modeling	219
